AN INDEPENDENT PRODUCT MANAGEMENT CASE STUDY

Prepared by Venkata
Product Manager Candidate | October 2026

Better product information. More confident journeys.

A constructive, evidence-led assessment of product specification governance, dealer consistency, Shopify merchandising and customer experience at Travel Buggy.

The opportunity

Build on Travel Buggy's travel-friendly mobility proposition by making critical specifications consistently accurate, accessible and actionable wherever customers and dealers encounter them.

Scope:

- CITY 2 PLUS cross-channel audit
- Competitive information practices
- Storefront quality
- 30/60/90-day action plan

Connecting the assessment to Travel Buggy's mission

Travel Buggy seeks to empower customers with portable mobility solutions that help them regain independence and "see their world again." Clear, reliable and consistent product information helps customers choose confidently and supports that mission.

Independent public-source assessment | 15 October 2026
Not commissioned by or affiliated with Travel Buggy.

01/ EXECUTIVE VIEW

Three priorities, one operating system

A focused assessment centered on purchase confidence and repeatable product operations — not a proposed redesign of the entire business.

1. Verify technical claims

Published CITY 2 PLUS values differ across the official product page, the December 2025 manual and a dealer listing. Confirm hardware revision and approved values before publishing any changes.

2. Standardize customer journeys

Introduce consistent product detail page modules for travel guidance, relevant FAQs, product-fit information, manuals and validated technical specifications.

3. Operationalize Product Information, Dealer Readiness & Launches

Create a version-controlled specification register, named reviewers, dealer update packs and recurring Shopify/dealer quality checks.

Assessment principles

- Evidence before judgment: visible differences do not establish which specification is technically correct.
- Customer safety and suitability first: prioritize capacity, incline, physical dimensions, terrain limits and battery guidance.
- Minimum viable process: solve content and governance problems before commissioning custom software.

Primary sources: Travel Buggy CITY 2 PLUS product page [1], manual V2 (December 2025) [2], Living Well HME [3], and candidate-provided observations and screenshots.

02 / CROSS-CHANNEL AUDIT

Where published specifications diverge

Selected customer-relevant attributes. Identical hardware revision and configuration across all sources have not been independently established.

Attribute	Official PDP [1]	Manual V2 [2]	Dealer [3]
Weight capacity	400 lbs	395 lbs	395 lbs
Range	25 km	20 km	25 km
Incline	12°	8°	12°
Turning radius	26 in	29.5 in	26 in
Speed	6 km/h	6 km/h	7 km/h
Front wheel	7 in	7 in	8 in
Charge cycles	Not stated	~500	~1,000
Seat-to-floor	19.5 in	21.7 in	19.5 in

Interpretation

Multiple public sources provide differing values for the same named model. Differences may reflect revisions, configurations, measurement conditions or outdated materials. The first action is revision-level reconciliation—not assuming a particular published value is incorrect.

Verification sequence

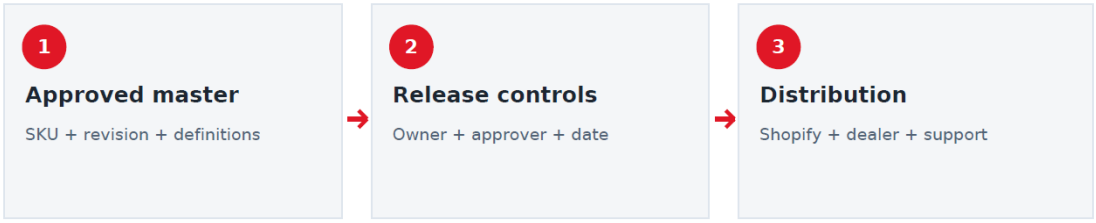

Match model, SKU and revision → identify engineering-approved technical documents → verify test conditions and definitions → publish approved content → document changes and notify dealers.

03 / OPERATING MODEL

One approved record, many channels

A practical product-information management pattern that can begin with a controlled spreadsheet and the existing Shopify workflow.

A SIMPLE GOVERNED PUBLISHING FLOW

Minimum viable data register

Control layer	Required record	Purpose
Identity	Model, immutable SKU, revision, market, effective date	Prevent version mix-ups
Technical specification	Value, unit, test conditions, approval reference	Make product claims traceable
Channel tracking	PDP, manual, brochure, dealer, support	Know where changes must propagate
Risk and review	Criticality, approver, change log, audit result	Prioritize controlled updates

Workflow for every material change

- **Draft** — Product Operations proposes an evidenced change with applicable revision.
- **Approve** — Technical specialist validates claims; additional functions review regulated or marketing language as appropriate.
- **Publish** — Ecommerce updates Shopify and Product Operations circulates dated dealer assets.
- **Verify** — Audit critical fields after launches/revisions and sample across channels weekly.

Dealer Product Information & Enablement

Establish a standardized dealer update package for every material product change, including:

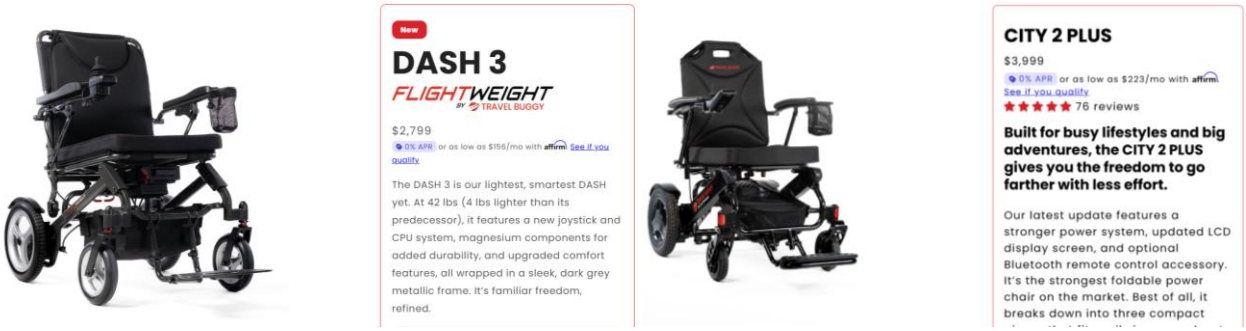

- Approved specifications, applicable SKUs and revision details.
- Updated product images, brochures, FAQs and sales talking points.
- Effective dates, discontinued information and required dealer actions.
- Acknowledgment tracking and follow-up verification.

Outcome: Enable sales representatives and dealers to communicate accurate, current product information and reduce inconsistencies across customer touchpoints.

4 / ECOMMERCE EXPERIENCE

Make product information easy to use

A consistent product page architecture improves comparison and maintenance without removing the personality of individual models.

Candidate-provided product page screenshots demonstrate varying summary hierarchy and financing-text wrapping. Screenshots are illustrative; validate across desktop and mobile breakpoints.

Product and UX backlog

Priority	Area	Suggested action
High	FAQ support journey	Fix legacy contact-path link; test the canonical support route [4].
High	Travel information	Consistently display battery energy, removal instructions and airline-specific caveats.
Medium	PDP template	Standardize headline, benefits, specifications, product FAQs and manuals.
Medium	French resources	Separate EN/FR manual downloads and assess French brochures and dealer assets.
Medium	Joystick configuration	Clarify left/right fitting; add purchase option only if required for fulfilment.
Low	Visual consistency	Normalize badges, text contrast, financing spacing and regional graphics.

05 / CLARITY AND CUSTOMER TRUST

Small wording gaps can create friction

Clarify commercial terms and distinguish promotional claims from verified technical information.

Shipping information — clarify the charge association

Observed issue: In the existing shipping-policy presentation, the wording and line break make it hard to immediately tell which order value receives free shipping and which incurs the $15 shipping charge. The information should not require the reader to mentally reconstruct the sentence.

Recommendation: Present the two cases separately with explicit labels, after verifying the actual Shopify shipping rules:

Order value	Shipping message (illustrative)
Orders qualifying for free shipping	FREE expedited shipping
Orders below the free-shipping threshold	$15 shipping charge

The shipping threshold, applicable order total, delivery method and geographic restrictions should follow the store's approved policy. The primary issue in this assessment is association and readability.

Air Travel — Improve Visibility of Travel-Friendly Features

Observation: Airline travel compatibility is not consistently promoted across product pages, despite customer reports of successful air travel.

Recommendation: Verify compatibility for each model and prominently highlight it across product pages, marketing materials, and dealer resources wherever supported. Avoid unverified claims.

Benefit: Stronger product differentiation, clearer travel-friendly positioning, and increased purchase confidence.

Environmental use — align marketing with instructions

A dealer describes light-snow usage, gravel and waterproof controls, while the manufacturer manual contains cautions around certain conditions. Verify approved environmental guidance before repeating or expanding these claims [2,3].

Suggested QA checks

- Shipping wording wraps clearly across desktop/mobile and matches checkout shipping charges.
- FAQ-to-contact navigation, financing-widget wrapping and product-document links function across breakpoints.
- Air-travel and environment claims have current approvals and revision references.

06 / COMPETITIVE LESSONS

Benchmark information quality, not only specifications

Because model purposes differ, benchmark the information that supports decisions rather than ranking unlike products by headline performance.

Reference	Strong documentation practice
WHILL Model C Lite	Charging time, weather rating, travel notes, positioning
Golden Cricket	Disassembly weight, drive/brake details, component warranty
QUICKIE Q500 M / Q4	Seat configuration, dimensions and drive setup
Permobil F5 Corpus VS	Powered positioning and detailed configurability

Recommended standardized attributes

- **Critical:** capacity, range with conditions, mass with and without batteries, folded size, incline, clearance, brakes and warranty.
- **Travel:** batteries and watt-hours, number included, removable-battery handling, charger specification and airline documentation.
- **Fit and service:** seating dimensions, controller mounting, adjustable components, accessories, replacement parts and language-specific instructions.

Research limitation: Competitor attributes were collected from the specifications supplied for this assessment. Technical capabilities and current claims should be validated against current manufacturer documentation.

07 / ACTION PLAN

A focused first 90 days

Sequence verification, storefront improvements and dealer execution; measure a baseline before setting numeric improvement targets.

Time	Focus	Deliverables
Days 1–30	Understand and verify	SKU/revision map; approved critical fields; fix contact link; QA baseline and named owners.
Days 31–60	Standardize and publish	Master record; PDP content modules; clearer shipping copy; EN/FR asset inventory; launch checklist.
Days 61–90	Synchronize and measure	Dealer change packs; weekly exception checks; post-launch verification and training materials.

Success measures

- Specification consistency: share of applicable published critical fields matching the approved revision.
- Verification coverage: share of active SKUs with dated, traceable and approved specifications.
- Publishing latency: time between approved change and updates across the required channels.
- Customer friction: broken links and enquiries concerning specifications, travel and accessory compatibility.
